Execution Plan Video Training

Block 1: Understanding execution plans

Level: Advanced

Chapter 4: Missing nodes

Query optimization

```
SELECT p.FirstName,  
       p.LastName,  
       p.Title  
FROM   Person.Person AS p  
WHERE  p.LastName = 'Kornelis';
```

Mostly not in scope

Except now

Query optimization

Phases in query optimization

Pre-processing

Parser

- Checks syntax

- Transforms query to parse tree

Algebrizer

- Binds names to objects

- Checks existence and permissions

- Inlines views and user-defined functions when possible

- Transforms parse tree to bound tree

Query optimization

Phases in query optimization

- Pre-processing

 - Parser

 - Algebrizer

- Actual optimization

 - Optimizer considers lots of possible execution plans

 - Cheapest estimated cost found within available search time is selected

 - Still beyond the scope of this course

- Post optimization cleanup

 - Various “obvious” standard replacements

Missing nodes

Property: *Node ID*

- Zero-based, consecutive numbers

- Assigned left to right, top to bottom

- Assigned at the end of actual optimization

- Not renumbered after / during post optimization cleanup

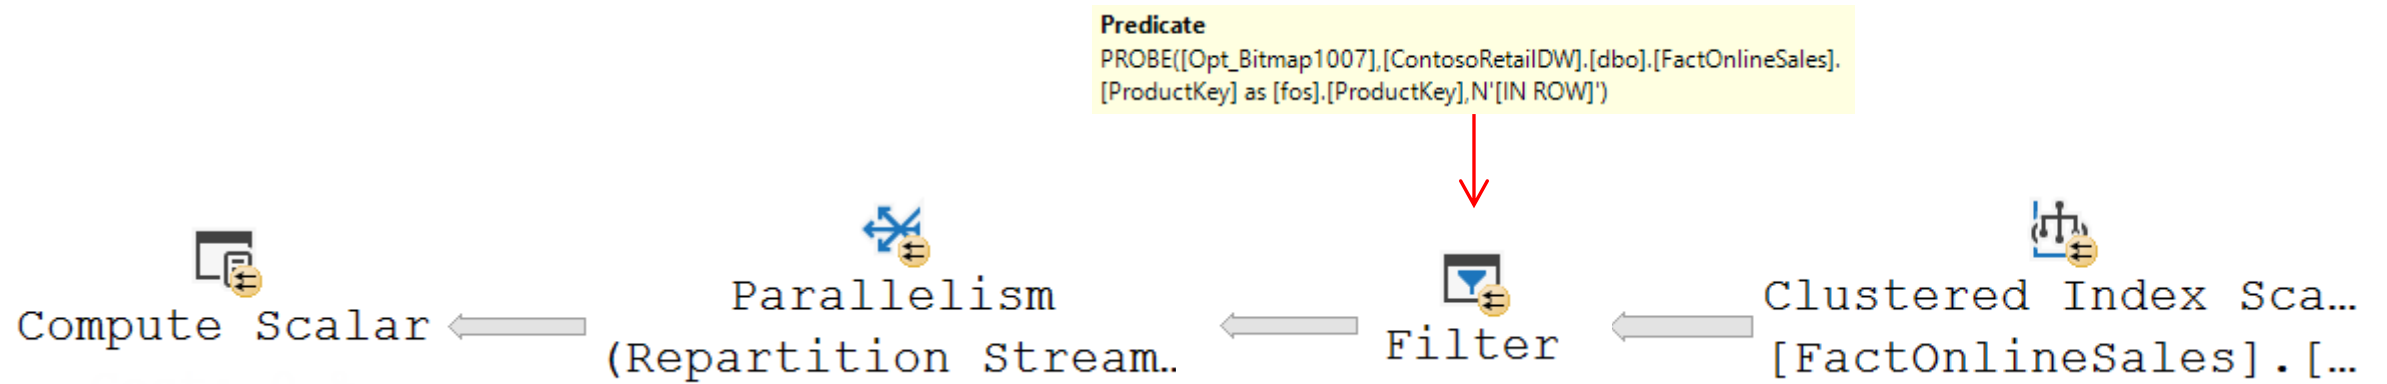

- Can be used to identify post optimization cleanup effects:

 - Gap in numbers indicates node was removed

 - Numbers out of order *probably* indicates operators where swapped

Most of the time, missing/swapped nodes are not irrelevant

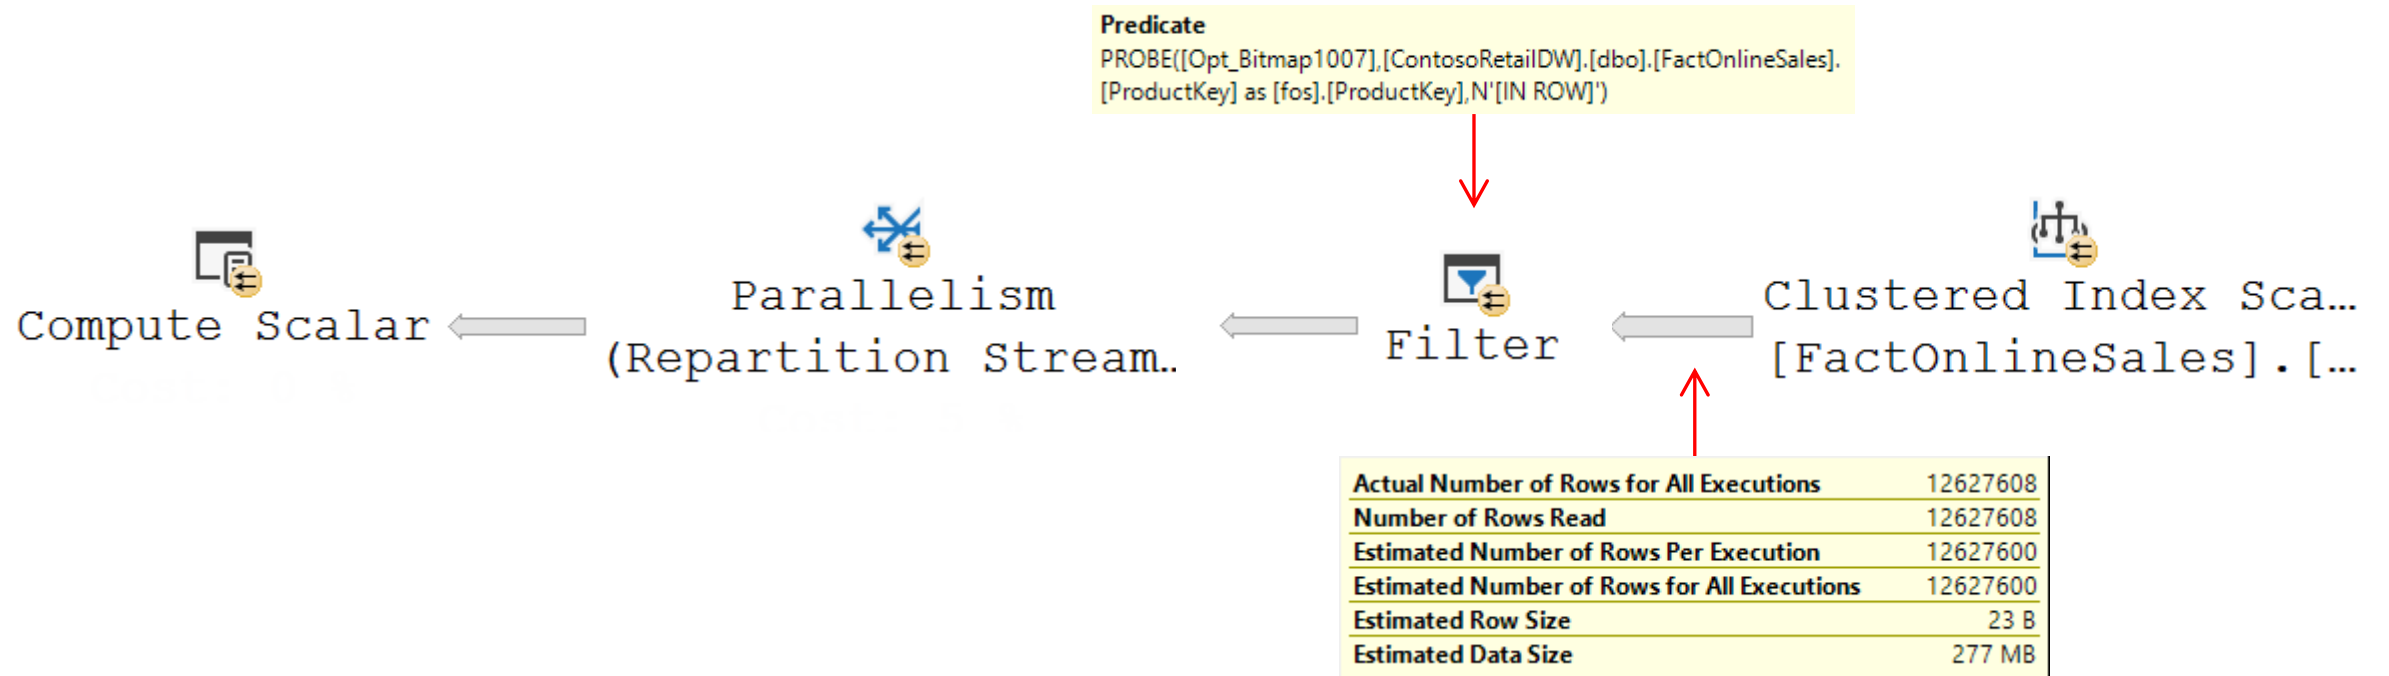

Missing nodes

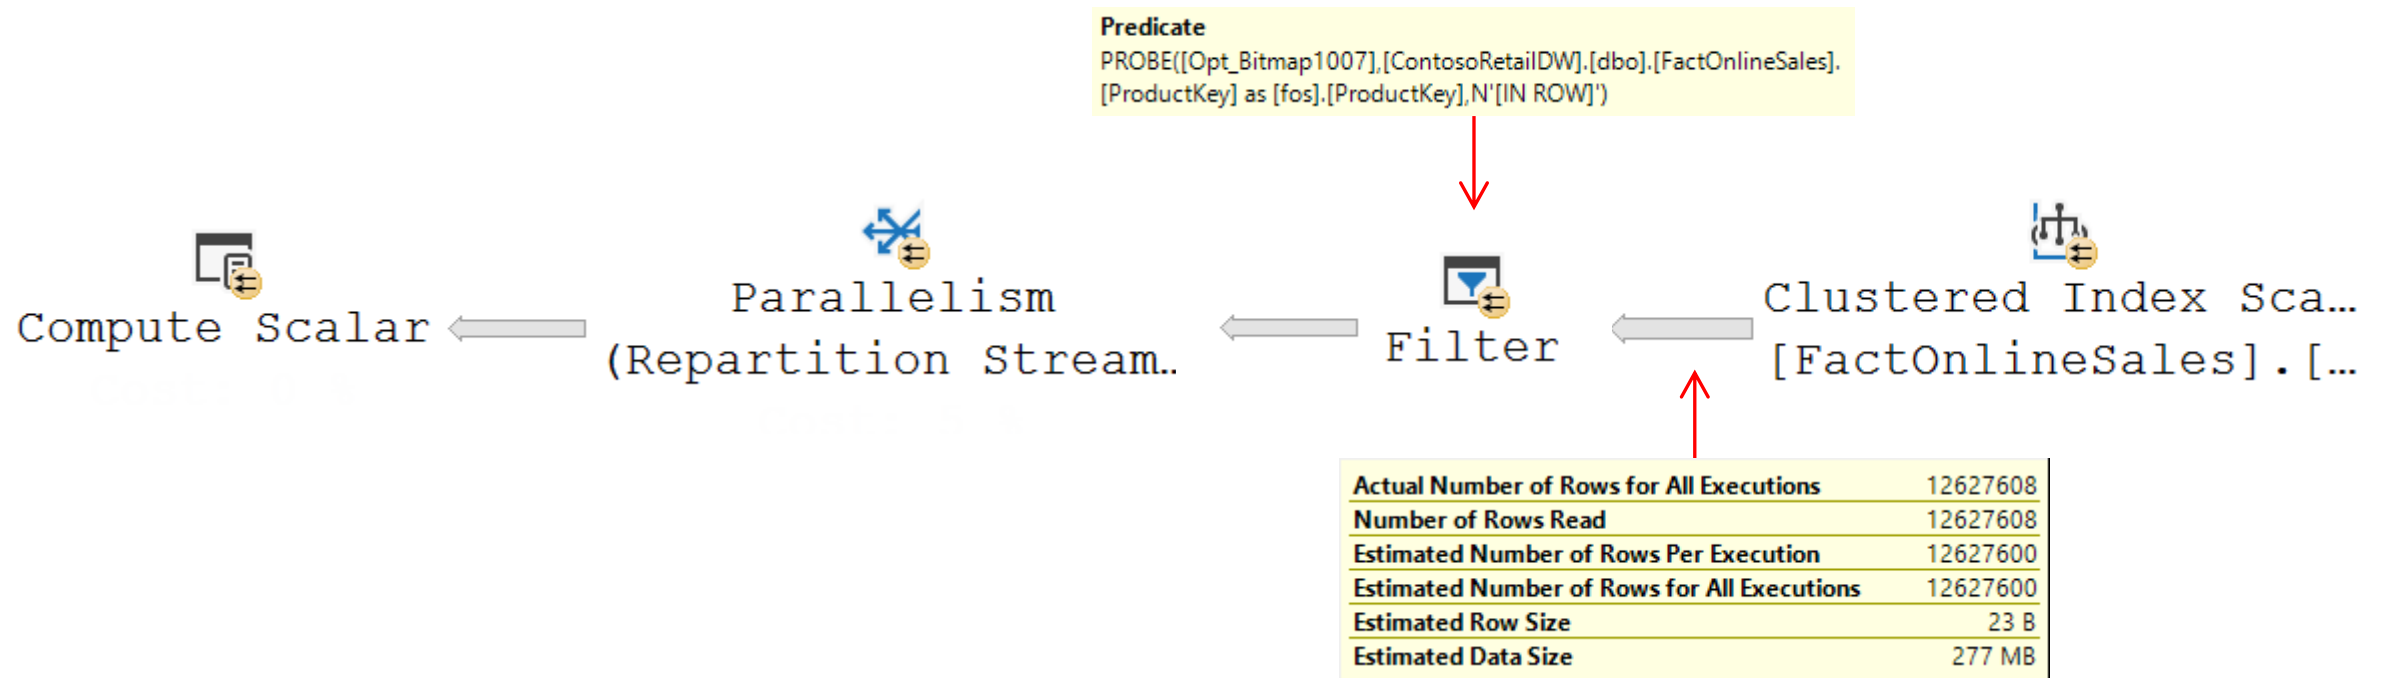

Missing nodes

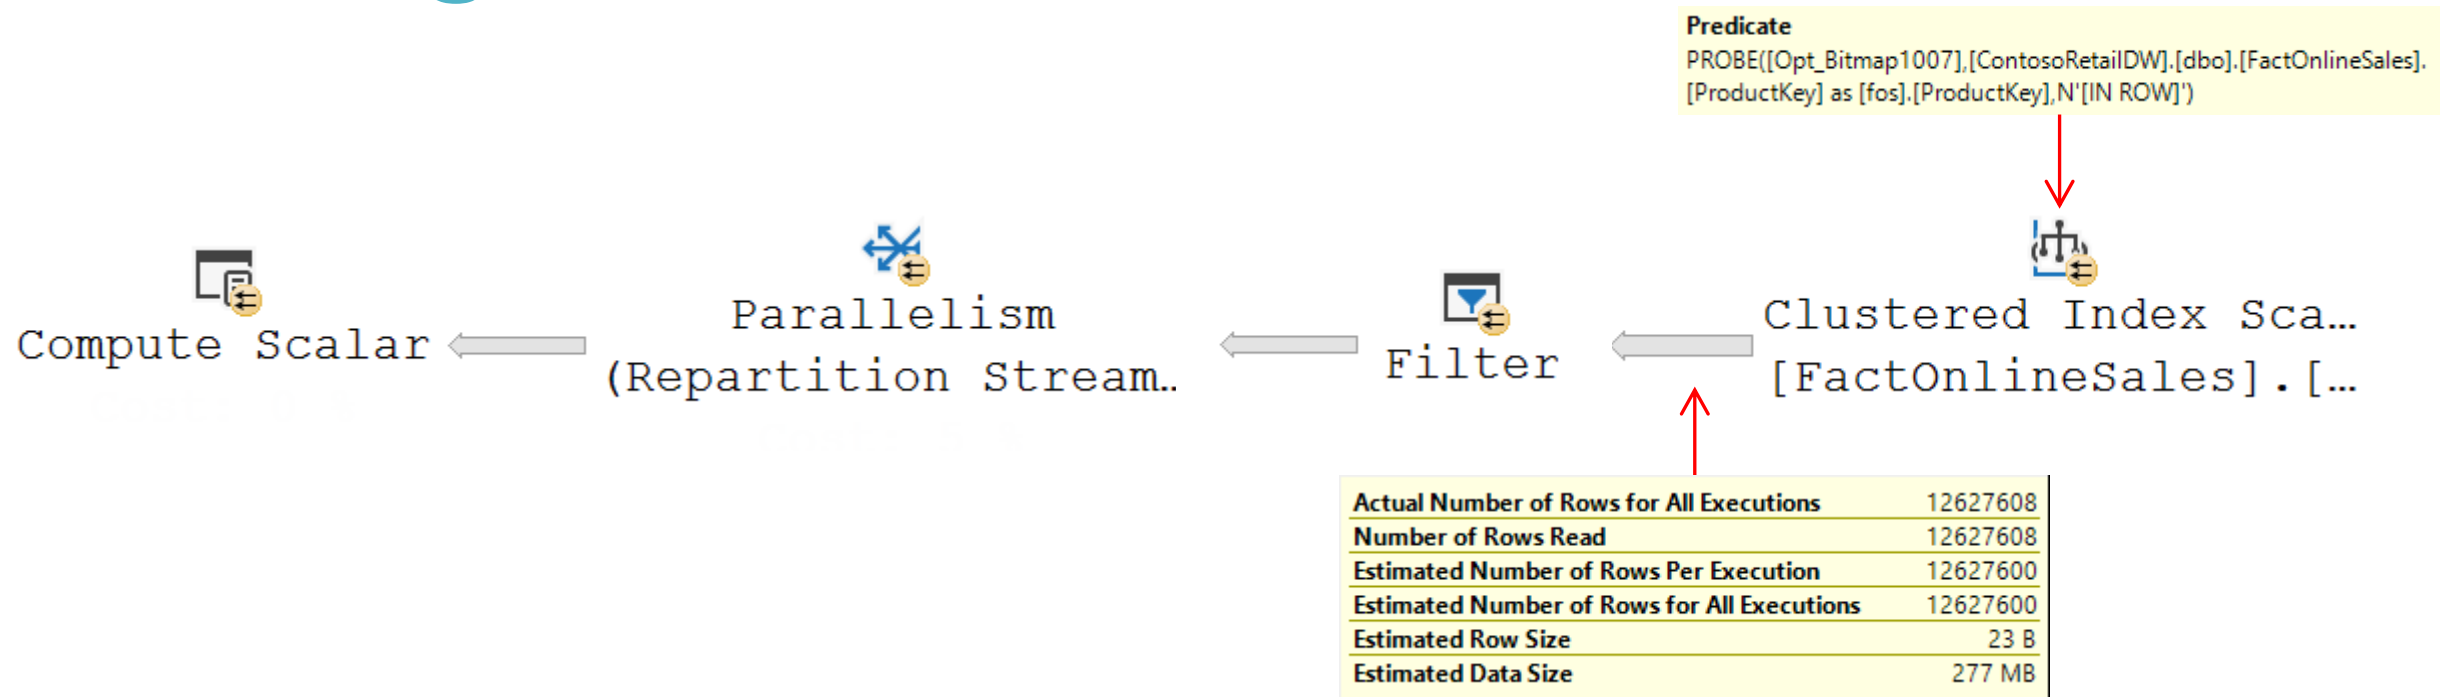

Missing nodes

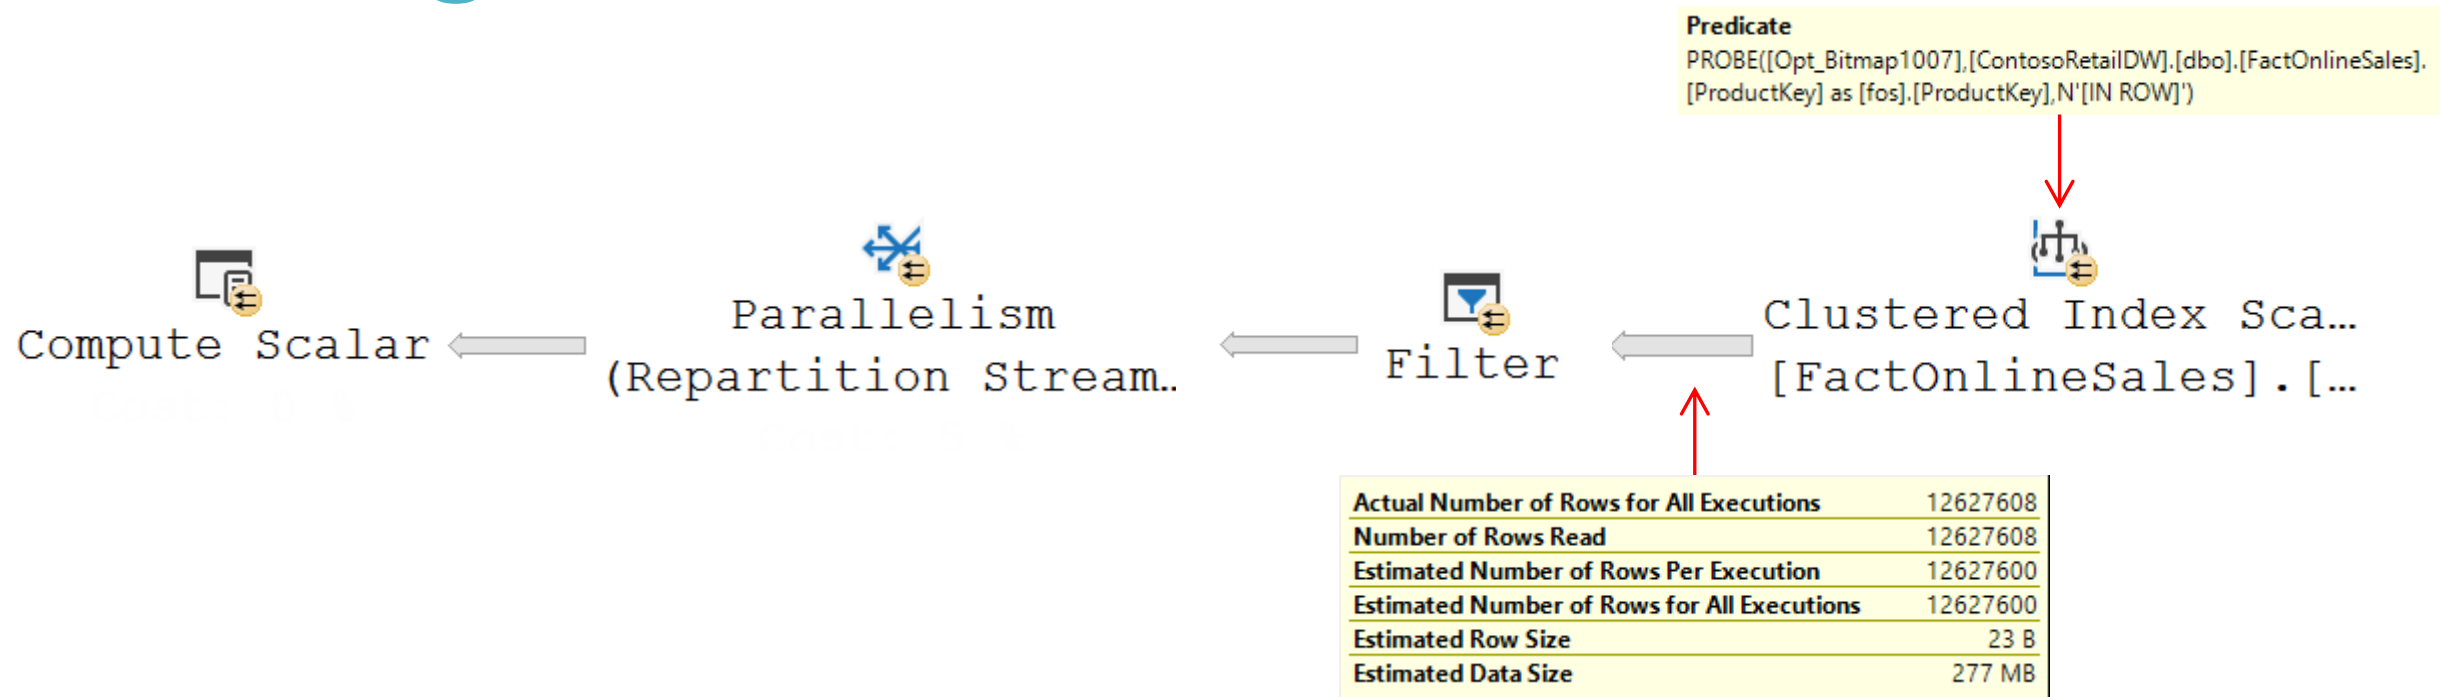

Missing nodes

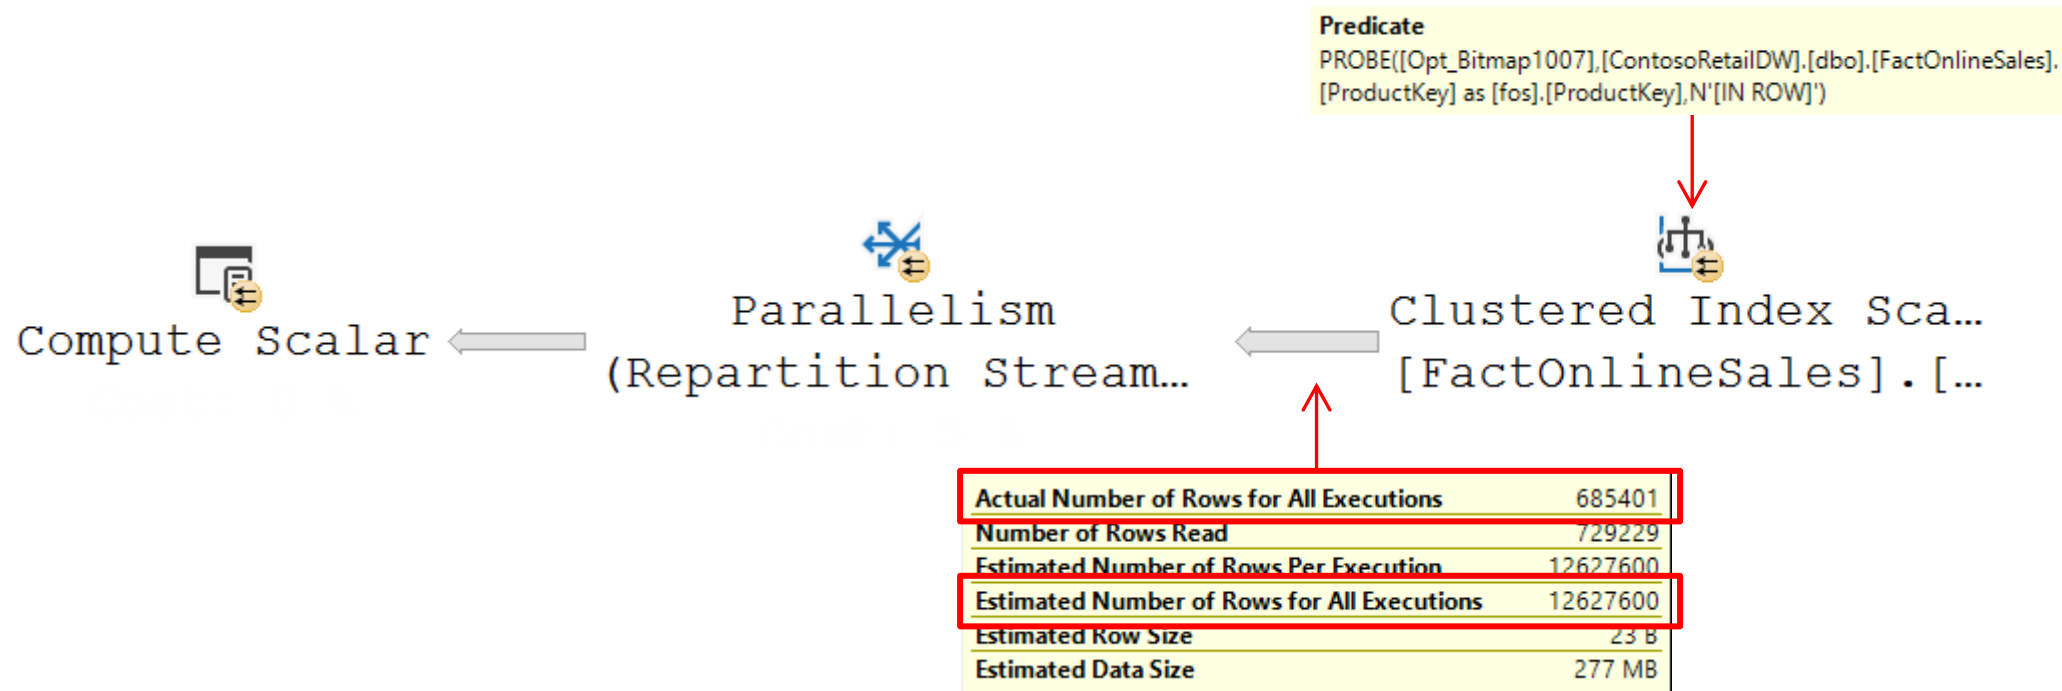

Missing nodes

Missing nodes

Missing nodes

Summary

Missing nodes

- Removed during post optimization cleanup

 - Details of this process are undocumented and largely unknown

- Recognized by “gap” in *Node ID* property

- Can affect properties

Not the only possible cause for “weird” properties!

Next chapters

Chapter 5: Batch mode versus row mode

- Differences between batch mode and row mode

- Limitations, drawbacks, and benefits of batch mode

- Requirements to get batch mode execution

- How batch mode execution displays in execution plans
